JLUXE / REAL ESTATE

Property Listing Input & Customer Information Guide

A practical framework for recording property opportunities accurately and presenting the right information to customers.

Prepared for property listing workflow planning

Purpose and key distinction

A property listing needs to explain three separate things: who is offering it, what is being offered, and what a customer needs to know before enquiring. Keeping these separate helps JLUXE record the source accurately without confusing it with the property type.

Question	Meaning	Example
Who is offering it?	Seller/source category and their relationship to the property.	Individual owner; developer; authorized representative.
What is offered?	Property type and its details.	Residential plot project; apartment; villa; commercial space.
What should customers see?	Verified public listing information that helps evaluation and enquiry.	Location, area, price basis, availability, images, JLUXE role.

1. Who may approach JLUXE?

JLUXE may receive opportunities from individuals and organizations. The recorded relationship should describe the submitter's connection to the property; it should not imply ownership or authority without verification.

Source category	Typical example	Possible JLUXE role
Individual property owner	A person offering their own plot, house, or commercial space.	Channel partner or authorized representative.
Property developer	A company developing plots, apartments, or a villa community.	Channel partner, marketing partner, or authorized representative.
Builder	A company constructing homes or commercial buildings.	Channel partner or sales partner.
Landowner / family	Land offered directly or through an appointed person.	Channel partner or authorized representative.
Owner-appointed representative	Agent, broker, or other appointed representative.	Authorized representative, subject to verification.
Project promoter / other organization	An organization promoting or offering a development.	Record and describe its verified relationship.

Important: A source category does not prove that the submitter can offer the property. Keep authorization evidence and verification notes private; publish only confirmed claims.

2. Separate source category from property type

A seller/source category answers “who brought this listing and what is their relationship to it?” A property type answers “what kind of property is being offered?” These should be separate fields.

For example, one listing could be a residential plot project supplied by a developer; another could be an individual owner’s residential plot represented by JLUXE. Both are plots, while their source, supporting records, and public attribution differ.

Suggested source and relationship fields

Field	Purpose
Source type	Individual owner, developer, builder, landowner, representative, promoter, or other.
Seller / organization name	Name of the person or organization offering the property.
Relationship to property	Owner, developer, builder, appointed representative, channel partner, or other.
Public attribution	Verified name or role approved for display to customers.
Authority verified	Internal confirmation that the submitter can offer or represent the property.
Verification records	Private notes and supporting records used by JLUXE to review claims.
Internal contact details	Private contact details used by JLUXE to coordinate the listing.

3. Shared property information to collect

Field	What to enter
Property / project title	Customer-facing name. Use a project name when one exists; otherwise use a clear descriptive title.
Property type	Plot, apartment, villa, independent house, commercial property, land, or other.
Location	Known city, locality, and relevant nearby area. Do not invent a precise address.
Description	Factual summary of the offering and its relevant features.
Price and price mode	Amount and whether exact, starting from, or on request. Label the basis, such as total or per sq. ft., where known.
Area and unit	Relevant plot, built-up, or other area with its unit and area basis.
Availability	Current status, such as available or under offer; update when it changes.
Publication status	Whether the listing is draft, public, or archived.
Images and gallery	Approved images or plans that relate to the actual property or project.
JLUXE representation	Accurate JLUXE role for this listing, such as channel partner or authorized representative.

4. Property-specific details

The admin form should adapt to the selected property type. Ask for relevant facts, and avoid forcing fields that do not apply.

Property type	Useful details to collect
Residential plot / land	Plot area and dimensions; plot number if appropriate to publish; road access or frontage if confirmed; layout or phase; available plot options; intended use if known.
Apartment	Configuration (such as 1, 2, or 3 BHK); unit area and basis; floor or unit availability where applicable; construction or possession status if verified; relevant common amenities.
Villa / independent house	Bedrooms; built-up and land area where known; floors; key features; construction or possession status; available variants.
Commercial property	Intended use; area and basis; floor or unit details; access and frontage where relevant; occupancy or handover status; verified usage restrictions.
Other property	Manually entered property type and concise explanation of what is offered.

Additional details for developers, builders, and promoters

- Developer, builder, or promoter name for public display, when confirmed.
- Project name, phase, project type, and total project area if confirmed.
- Development status and expected milestones when supplied and verified.
- Approval or registration details with the issuing authority and exact reference, where appropriate.
- Amenities, configurations, plans, and project documents relevant to the offering.

Do not display approval badges or state that a project is approved based only on an unverified seller description.

Additional records for individual owners or representatives

- Record whether the submitter is the owner or an appointed representative.
- Record the relevant authorization or authority evidence for internal review.
- Keep private contact details and any restrictions on public address or identity disclosure in internal records.

A project with multiple plot or unit options can remain one project listing, with each option recording its own area, price, and availability where the current system supports it. Avoid duplicate project pages solely to represent each option.

5. What customers should see

Customers need enough verified information to understand the property, compare it with their needs, and ask a useful question. Public pages should show listing facts, not internal admin workflow.

Recommended information for every listing

- Property or project title and the property type.
- Location at the level approved for public display.
- Relevant photos or plans that represent the actual listing.
- Price and its basis when available; otherwise state that the price is available on request.
- Area and unit when known, with the area basis made clear.
- Current availability, a factual description, and verified highlights.
- JLUXE's role, described accurately, with a clear property enquiry option.

Public attribution by source

Source	Customer-facing presentation
Individual owner	Explain JLUXE's verified role. The owner's identity can remain private.
Developer / builder	Show the developer or builder name when confirmed and relevant, alongside JLUXE's role.
Authorized representative	Describe JLUXE's role only as supported by the authorization.
Promoter / other organization	Identify the organization and its relationship to the property only after verification.

Never imply JLUXE is the owner, developer, or builder unless that is true for the specific listing.

Useful additional public information by property type

Type	Show when supplied and verified
Plots and land	Area, dimensions, layout or phase, clear price basis, relevant location context, approval/registration details with precise wording, real amenities, and available options.
Apartments, villas, houses	Configuration, area and its basis, unit or layout variants and price range if available, construction/possession status, amenities, and current availability.
Commercial	Intended use, area and basis, floor/frontage/access where relevant, price or rent basis if applicable, occupancy/handover status, and known usage restrictions.

6. Keep internal records separate

Internal / admin only	Public listing
Seller phone and email.	Approved property facts and public-facing attribution.
Authorization evidence and verification notes.	Location and relevant property details approved for display.
Identity or ownership records.	Images or plans approved for the listing.
Negotiation notes and unpublished pricing details.	Price or price-on-request wording, with a clear basis.
Private address or disclosure restrictions.	Enquiry route and accurate JLUXE representation.

This separation lets JLUXE verify a listing without exposing private seller information or making unsupported public claims.

7. Recommended admin form structure

Form group	What it covers
1. Listing source and JLUXE role	Who submitted the listing, their relationship to it, and the verified representation type.
2. Basic property information	Title, location, property type, and description.
3. Property-specific details	Conditional fields based on plots, apartments, villas, houses, commercial, or other.
4. Configurations and pricing	One or more options when a listing includes multiple plots or units.
5. Approvals and verification	Supporting records and a clear distinction between verified and unverified claims.
6. Media	Cover image, gallery, and relevant plans.
7. Publication	Availability and publication status, plus a review of the customer-facing page.

Guiding principle
Collect enough information to verify and describe the listing; show customers only relevant, confirmed details.

Planning note

This guide is a planning framework. Before changing JLUXE's admin workflow, compare these recommendations with the project's existing property fields, database schema, media workflow, enquiry behavior, and current publication rules. Reuse existing capabilities where they already meet the need.
